Jimmy Tran . Jarvis Consulting

I studied Computer Science and graduated from Toronto Metropolitan University with a minor in economics. As a Technical Consultant at Jarvis Consulting, I actively cultivate my skills by tackling diverse and challenging projects. In a previous role, I developed impactful solutions, creating a restaurant's website, POS system, and Reservation Management app. My passion for problem-solving and commitment to continuous learning drive my pursuit of a developer role. At Jarvis, I've gained proficiency in technologies such as Java, Linux/Bash, SQL, and Docker to complement my knowledge in JavaScript, HTML/CSS, React.js, Node.js, Express.js, and MongoDB. Beyond work, I take care of my physical and mental well-being through sports, working out and playing video games with friends.

Skills

Proficient: JavaScript, HTML/CSS, Java, RDBMS/SQL, Linux/Bash, Git

Competent: Python, React.js, Node.js, Express.js, Agile/Scrum

Familiar: Postman, Docker, MongoDB, PostgresQL, GraphQL

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_JimmyTran

Linux Cluster Resource Monitoring App [GitHub]: Developed an automated monitoring agent to document hardware specifications as well as resource usage of Linux nodes for data analytics. The nodes specifically ran on CentOS 7 and used Bash/Shell scripts to obtain hardware info and resource usage. The information was stored in an RDBMS via a Docker and PostgreSQL instance. Crontab was used to automate the data collection and insertion into the SQL tables.

Highlighted Projects

Reservation Management Web App [GitHub]: Developed a web app for restaurants to help manage reservations with a visual representation of table availability. Users are able to colour-code each reservation to indicate if patrons have arrived or cancelled. Utilizing HTML, CSS, Javascript, React.js, Express.js, Node.js, and MongoDB, users are able to create reservations and view all reservations via a timetable.

Point of Sales System [GitHub]: Implemented a Point of Sales system web app to allow vendors to have a cloud-based POS system to keep track of table orders. Server users are able to take table orders and print receipts while Administrator users are also able to perform CRUD operations on user accounts, menu items, and tables. HTML, CSS, Javascript, React.js, Express.js, Node.js, and MongoDB were used to create the web app.

Professional Experiences

Software Developer, Jarvis (Nov 2023 - Present): Collaborated with a team of developers to create various projects utilizing Agile philosophy to develop a diverse set of projects, learning valuable skills such as Docker, Linux/Bash, PostgreSQL, and Git.

Software Engineer, Robot Boil House (June 2021 - Sept 2023): Designed and developed multiple contract-based projects for a client, spanning reservation management, point-of-sale system, and website development using technologies such as React.js, Express.js, Node.js, MongoDB, HTML, and CSS. Achieved cost savings of $1000 annually for the client's POS system and significantly enhanced worker efficiency by reducing operation times from minutes to seconds during reservation management. The website, attracting an average of 7500 monthly visitors, successfully recaptured 10%-30% of revenue from UberEats' pick-up and delivery services.

Education

Toronto Metropolitan University (2016-2021), Honours Bachelor of Science, Computer Science - Minor in Economics

Miscellaneous

- Activities: Tennis, Badminton, Ping Pong, Rock Climbing
- Hobbies: Board Games, Video Games, Escape Rooms
- Relaxation: Cooking, Watching Horror Movies
